ACKNOWLEDGMENTS

Messrs. Raymond J. Beauchesne* and William E. Boisvert made major contributions to this atlas.

*Mr. Beauchesne presently is employed by the Bureau of Naval Personnel.

FOREWORD

THIS ATLAS, ONE IN A SERIES OF 43 REGIONAL SURFACE CURE IS PRODUCED TO FULFILL A NEED OF NAVY PLANNING STAFFS AND THE SCI INDUSTRIAL COMMUNITIES FOR THE LATEST AVAILABLE OCEAN SURFACE CURE THESE ATLASES ADD TO THE WEALTH OF NAUTICAL INFORMATION UPON WHICH TIONAL PLANNING, NAVIGATIONAL SAFETY, AND SHIPPING ECONOMY DEPEND PRODUCTION AND WIDE DISSEMINATION OF THIS ATLAS ARE MADE POSSIBLE LATEST COMPUTER TECHNIQUES.

THE CONSTANT IMPROVEMENT IN THE QUALITY OF SURFACE CURR RECEIVED OVER THE YEARS IS MADE POSSIBLE LARGELY BY THE MORE THOR OF VOLUNTARY OBSERVERS IN RECENT YEARS. THE DEFENSE MAPPING AGEN OCEANOGRAPHIC OFFICE, AND THE USER OF THE ATLASES RELY ON THE PER SERVATIONS OF THE MAN WHO HAS "BEEN THERE." MARINERS, IN REPORTI OBSERVATIONS, RENDER A SERVICE NOT ONLY TO THEMSELVES BUT ALSO TO GO DOWN TO THE SEA IN SHIPS." WITH THE ADVENT OF NUCLEAR POWER, NAVIGATION AIDS, AND 300,000-TON SHIPS, UP-TO-DATE, RAPIDLY DISSE ENVIRONMENTAL AND NAVIGATIONAL INFORMATION HAS BECOME INCREASINGLY

JOHN R. McDONNELL Captain, U.S. Navy

Commander

FOREWORD

IE IN A SERIES OF 43 REGIONAL SURFACE CURRENT ATLASES, NEED OF NAVY PLANNING STAFFS AND THE SCIENTIFIC AND OR THE LATEST AVAILABLE OCEAN SURFACE CURRENT DATA.

WEALTH OF NAUTICAL INFORMATION UPON WHICH OPERACIONAL SAFETY, AND SHIPPING ECONOMY DEPEND. RAPID SEMINATION OF THIS ATLAS ARE MADE POSSIBLE BY THE JES.

IMPROVEMENT IN THE QUALITY OF SURFACE CURRENT DATA IS MADE POSSIBLE LARGELY BY THE MORE THOROUGH REPORTS IN RECENT YEARS. THE DEFENSE MAPPING AGENCY, THE ND THE USER OF THE ATLASES RELY ON THE PERSONAL OBHO HAS "BEEN THERE." MARINERS, IN REPORTING THEIR SERVICE NOT ONLY TO THEMSELVES BUT ALSO TO ALL "WHO HIPS." WITH THE ADVENT OF NUCLEAR POWER, ELECTRONIC 0,000-TON SHIPS, UP-TO-DATE, RAPIDLY DISSEMINATED ATIONAL INFORMATION HAS BECOME INCREASINGLY IMPORTANT.

JOHN R. McDONNELL Captain, U.S. Navy Commander

SURFACE CURRENT ATLASES

THIS SERIES OF COMPUTERIZED ATLASES REPLACES THE OLD HYDROGRAPHIC OFFICE ATLASES OF SURFACE CURRENTS (HOP 566, 568, 569, 570) WHICH WERE MANUALLY COMPILED FROM DATA OBTAINED DURING THE PERIOD 1903 - 1934. THESE NEW ATLASES CONFORM TO THE STANDARD NAVY OCEAN AREA AND REGION INDEX LIMITS SHOWN BELOW: e.g., NOO SP 1402-NP 10 COVERS NORTH PACIFIC REGION 10 EAST OF THE PHILIPPINES.

AS AMOUNTS OF NEW DATA

THESE GRAPHICS MA AREAS AS THE NORTH SEA. CURRENTS ARE STRONGLY I PREDICTABLE HOURLY CHAM-

RECENT IMPROVEMENTS IN THE DATA FILE ASSURE THE INCLUSION OF THE LATEST, HIGH QUALITY SURFACE CURRENT DATA AVAILABLE. THE FILE NOW CONTAINS MORE THAN 4,200,000 OBSERVATIONS AND A GENERAL UPDATE OF THE FILE WILL BE MADE

IFACE CURRENT ATLASES

FICE

AS AMOUNTS OF NEW DATA WARRANT, MOST LIKELY EVERY 12 - 18 MONTHS.

SES W: INES. THESE GRAPHICS MAY NOT BE TRULY REPRESENTATIVE OF THE ACTUAL FLOW IN SUCH AREAS AS THE NORTH SEA, PERSIAN GULF, GULF OF THAILAND, AND YELLOW SEA WHERE CURRENTS ARE STRONGLY TIDAL. FOR SUCH AREAS, OTHER SOURCES DESCRIBING PREDICTABLE HOURLY CHANGES OF TIDAL CURRENTS SHOULD BE CONSULTED.

iT,

The Surface Current Data File, from which these atlases are derived, consists primarily of over four million ship set and drift observations. These data were collected by the Metherlands, Japan, Britain, France, and the United States. The file is supplemented by several thousand Geomagnetic Electrokinetograph (CEX) observations, mostly Japanese. The file spans the period from the early 1850's to the present. The earliest observations were collected by the Metherlands and Great Britain; those of the 1960's through the present are primarily United States data.

General Quality

The quality of this data file is considered high for this type of derived value. The data have been carefully screened for duplication; observations taken under adverse conditions (i.e. high winds and waves, time between observations greater than 12 hours) have been eliminated when warranted. Consideration was given to the reliability of the observer; doubtful shipboard computations of set and drift were edited; and observations with erroneous locations (mostly observations on land) have been eliminated. The accepted data are considered most useful when used collectively as in summaries where a number of observations show trends.

General Observation Technique

The set (direction) and drift (speed) are computed by the navigator from the difference between the dead reckoning (DR) position and the position determined by any type of navigational fix. The drift can be determined along any straight line track and includes all factors which cause changes in the DR position. When a fix is obtained, the current set (direction) is FROM the DR position TO the fix; the drift (speed) is equal to the distance in nautical miles between the DR and the fix, divided by the number of hours since the last fix. For successive observations, the TO POSITION of one observation because the FROM POSITION of the next observation.

Because the influence of current may vary along a ship's track, the MEAN POSITION of the track is assigned as the geographic location of the current observation. An example of a current computation is shown in the figure below.

EXAMPLE OF A SURFACE CURRENT (SHIP'S DRIFT) OBSERVATION

Data Presentation

The following legend shows two types of surface current presentations by 1° quadrangle, type 1 with 12 or more observations and type 2 with fewer than 12 observations. Where there are 11 or fewer observations within a 1° quadrangle, the total number of observations is shown within the 90° quadrant containing the observations.

If there are 12 or more obser by vector resultants as follo

(1) Persistent Current - 60 percent or more of all observations fall within a 45° sector of the 8-point compass.

(2) Prev

(4) Bizonal Flow - Practically all obse are concentrated in opposite pairs sectors, and one pair contains at 1 80 percent as many observations as pair. This generally indicates var that occurs in zones of entrainment opposing currents (see examples A a quadrangles 1, 2, and 3).

If there are 12 or more observations in a 1 $^{\circ}$ quadrangle, the surface current is depicted by vector resultants as follows:

 Persistent Current - 60 percent or more of all observations fall within a 45° sector of the 8-point compass.

NS).

EVATIONS.

- (2) Prevailing Current 70 percent or more of all observations fall within two adjacent 45° sectors.
- (3) Primary Current with Secondary Direction
 (a) Primary Current 50 percent or more of all observations fall within three adjacent 45° sectors.
 - (b) Secondary Direction 20 percent or more of all observations fall within a 45° sector, and the two resultant vector directions are separated by more than 90° of arc.

- (4) <u>Bizonal Flow</u> Practically all observations are concentrated in opposite pairs of 45° sectors, and one pair contains at least 80 percent as many observations as the opposite pair. This generally indicates variability that occurs in zones of entrainment between opposing currents (see examples A and B, quadrangles 1, 2, and 3).
- (5) Variable Current The 45° sector with most observations has less than 25 percent of all observations; direction is indeterminate.

DISTRIBUTION STATEMENT (of the abstract entered in Block 20, if different from Report)

Surface Currents Northwest South Pacific Ocean Coral Sea Solomon Sea

ABSTRACT (Continue on reverse side if necessary and identify by .lock masher,

This atlas, and the series of which it is a part, is computer generated and automatically plotted. It makes available to the user the most recent surface current data collected and will be updated whenever sufficient amounts of data are added to the data file. This and the other atlases are based on a bast quantity of data as compared to the previous manually-compiled editions printed in the mid-thirties.

SECURITY CLASSIFICATION OF THIS PAGE (When Bute Bittered)

SECURITY CLASSIFICATION OF THIS PAGE(When Data Entered)

20. Cont.

The surface current information is based mainly on ship drift, which is the difference between the dead reckoning position and the position determined by any type of navigational fix. This difference describes the direction and speed of the current.
